## CROSS REFERENCE TO RELATED APPLICATIONS

This application claims the benefit of US provisional application Serial No. 60/309,832 filed on 03 August 2001, under 35 USC 119(e)(i) and US provisional application Serial No. 60/326,885 filed on 03 October, 2001, under 35 USC 119(e)(i), which are incorporated herein by reference in their entirety.

BACKGROUND OF THE INVENTION1. Field of the Invention

The present invention relates to substituted 5-arylsulfonyl indoles and indolines which interact with serotonin receptors, such as 5-HT<sub>6</sub> receptors, and are useful for treating anxiety, depression, schizophrenia, stress-related disorders such as irritable bowel syndrome, panic, a phobia, obsessive compulsive disorder, obesity, post-traumatic stress syndrome, epilepsy, and other central nervous system (CNS) disorders in humans and animals.

The major classes of serotonin receptors (5-HT<sub>1-7</sub>) contain fourteen to eighteen separate receptors that have been formally classified. See Glennon, et al., Neuroscience and Behavioral Reviews, 1990, 14, 35; and D. Hoyer, et al. Pharmacol. Rev. 1994, 46, 157-203. There is currently a need for pharmaceutical agents that are useful to treat diseases and conditions that are associated with 5-HT receptors. In particular, there is a need for agents that can selectively bind to individual receptor sub-types (e.g. receptor-specific agonists or antagonists); such agents would be useful as pharmaceutical agents, or would be useful to facilitate the study of the 5-HT receptor family, or to aid in the identification of other compounds that selectively bind to the specific 5-HT receptors.

For example, the 5-HT<sub>6</sub> receptor was identified in 1993 (Monsma et al. Mol. Pharmacol. 1993, 43, 320-327 and Ruat, M. et al. Biochem. Biophys. Res. Com. 1993, 193, 269-276). Several antidepressants and atypical antipsychotics bind to the 5-HT<sub>6</sub> receptor with high affinity and this binding may be a factor in their profile of activities (Roth et al. J. Pharm. Exp. Therapeut. 1994, 268, 1403-1410; Sleight et al. Exp. Opin. Ther. Patents 1998, 8, 1217-1224; Bourson et al. Brit. J. Pharm. 1998, 125, 1562-1566; Boess et al. Mol. Pharmacol. 1998, 54, 577-583; Sleight et al. Brit. J. Pharmacol. 1998, 124, 556-562). In addition, the 5-HT<sub>6</sub> receptor has been linked to generalized stress and anxiety states (Yoshioka et al. Life Sciences 1998, 17/18, 1473-1477). Together these studies and observations suggest that compounds that antagonize the 5-HT<sub>6</sub> receptor will be useful in treating disorders of the central nervous system, such as anxiety, depression, schizophrenia, stress-related disorders such as irritable bowel syndrome, panic, a phobia, obsessive compulsive disorder, obesity, post-traumatic stress syndrome, and epilepsy. In general, compounds of formula I exhibit selective inhibition of 5-HT<sub>6</sub> serotonin receptors relative to the inhibition of other 5-HT serotonin receptors.

General anxiety disorder (GAD) occurs when a person worries about things such as family, health, or work when there is no reason to worry and is unable not to worry. About 3 to 4% of the U.S. population has GAD during the course of a year. GAD most often strikes people in childhood or adolescence, but can begin in adulthood, too. It affects women more often than men. Currently, treatment involves cognitive-behavioral therapy, relaxation techniques, and biofeedback to control muscle tension and medications such as benzodiazepines, imipramine, and buspirone. These drugs are effective but all have side-effect liabilities. Therefore, there is a

need of a pharmaceutical agent to address the symptoms with fewer side effects.

Depression is a mood disorder of varying lengths of normally several months to more than two years and of varying degrees of feelings involving sadness, despair, and discouragement. The heterocyclic antidepressants (HCA's) are currently the largest class of antidepressants, but monoamine oxidase inhibitors (MAOI's) are used in particular types of depression. Common side effects from HCA's are sedation and weight gain. In elderly patients with organic brain disease, the side effects from HCA's can also include seizures and behavioral symptoms. The main side effects from using MAOI's occur from dietary and drug interactions. Therefore, agents with fewer side effects would be useful.

Schizophrenia is a disease having multiple aspects. Currently available drugs are generally aimed at controlling the positive aspects of schizophrenia, such as delusions. One drug, Clozapine, is aimed at a broader spectrum of symptoms associated with schizophrenia. This drug has many side effects and is thus not suitable for many patients. Thus, there is a need for a drug to treat the cognitive and attention deficits associated with schizophrenia. Similarly, there is a need for a drug to treat the cognitive and attention deficits associated with schizoaffective disorders, or similar symptoms found in the relatives of schizophrenic patients.

Post-traumatic stress disorder (PTSD) is a form of anxiety triggered by memories of a traumatic event that directly affected the patient or that the patient may have witnessed. The disorder commonly affects survivors of traumatic events including sexual assault, physical assault, war, torture, natural disasters, an automobile accident, an airplane crash, a hostage situation, or a death camp. The affliction also can affect rescue workers at an airplane crash or a mass shooting, someone

who witnessed a tragic accident or someone who has unexpectedly lost a loved one. Treatment for PTSD includes cognitive-behavioral therapy, group psychotherapy, and medications such as Clonazepam, Lorazepam and selective serotonin-reuptake inhibitors such as Fluoxetine, Sertraline, Paroxetine, Citalopram and Fluvoxamine. These medications help control anxiety as well as depression. Various forms of exposure therapy (such as systemic desensitization and imaginal flooding) have all been used with PTSD patients. Exposure treatment for PTSD involves repeated reliving of the trauma, under controlled conditions, with the aim of facilitating the processing of the trauma. Therefore, there is a need for better pharmaceutical agents to treat post-traumatic stress disorder.

Stress may increase the release of epinephrine from the adrenal medulla and norepinephrine from adrenergic neurons activated by central nervous system (CNS) stimulation. High levels of circulating epinephrine mediate alpha-adrenergic effects including increases in heart rate and cardiac output. Epinephrine may also be taken up by beta<sub>2</sub> receptors on the presynaptic neuronal membrane and may enhance release of norepinephrine from storage granules. Transient epinephrine surges resulting from stress may produce considerably more prolonged vasoconstriction. Stress-induced activation of the sympathetic nervous system may lead to hypertension. Stress also can cause stress gastritis and affect the efficacy of medical treatment in some ulcer patients. There is a need for pharmaceutical agents to treat stress-related diseases.

Panic disorders, phobias, and obsessive compulsive behavior are forms of neurosis. They are all related to excessive anxiety. All humans experience fear and anxiety in response to an external threat, or a difficult situation. However, the neuroses noted above, are

abnormal responses to ordinary situations. The causes of such neurotic disorders are not fully known.

Anxiety can arise suddenly, as in panic, or gradually over many minutes, hours, or even days. Anxiety may last for variable periods of time ranging from less than a minute to years. Brief panic attacks are common. However, most persons recover without treatment, and panic disorder is much less common.

Phobias are similar to panic attacks in that they involve anxiety. However, in the various phobias the anxiety is not the free-floating anxiety of panic disorder, but instead focuses on specific situations or stimuli. Persons who have a phobia often realize that their anxiety is excessive, but nonetheless, they tend to avoid the situations or stimuli that disturb them. If they must be exposed to such situations or stimuli they endure them with great distress. Some relatively commonly observed phobias include agoraphobia, that is, the fear of being trapped in closed places, fear of snakes, fear of heights, fear of the dark, fear of strangers, fear of storms, fear of water, heights, and fear of flying.

Persons suffering from an obsessive-compulsive disorder feel compelled to perform repetitive, purposeful, rituals to control their obsessions. For example, a person with an obsessive fear of contamination might compensate with excessive hand washing.

These panic and anxiety disorders may be treated with behavior therapy and antidepressants and benzodiazepines. Obsessive compulsive disorders may be treated with behavior therapy and various drugs such as serotonin reuptake inhibitors (SRIs), selective serotonin reuptake inhibitors (SSRIs—e.g., fluoxetine, fluvoxamine, paroxetine, sertraline), and clomipramine (a tricyclic antidepressant). Augmentation with haloperidol, or atypical antipsychotics may be effective. However, these drugs, especially the benzodiazepines and the

antipsychotics, have potentially serious side effects. Therefore, there is a need for a pharmaceutical agent to treat these conditions.

Epilepsy is a recurrent, paroxysmal disorder of cerebral function characterized by sudden, brief attacks of altered consciousness, motor activity, sensory phenomena, or inappropriate behavior caused by excessive discharge of cerebral neurons. Treatment aims primarily to control seizures. A causative disorder may need to be treated as well. No single drug controls all types of seizures, and different drugs are required for different patients. Patients rarely require several drugs. Commonly used drugs include phenytoin, carbamazepine, or valproate gabapentin, lamotrigine, and topiramate. Therefore, there is a need for a pharmaceutical agent to treat epilepsy.

Traditionally, obesity has been defined as a body weight of > 30% above ideal or desirable weight on standard height-weight tables. Currently, obesity is usually defined in terms of the body mass index (BMI)--weight (in kilograms) divided by the square of the height (in meters). The general cause of obesity is simple--expending less energy than is consumed. However, how people regulate body weight, primarily body fat, is still elusive and not fully understood. Typically, the determinants of obesity are divided into three categories: genetic, environmental, and regulatory. Recent genetic discoveries have helped explain how genes may determine obesity and how they may influence the regulation of body weight. Scientific studies estimate that genetics may account for about 33% of the variation in body weight. The remaining variation may be caused by environmental and regulatory factors. Environmental factors include socioeconomic status, large food intake, and sedentary lifestyle. Regulatory factors include pregnancy, endocrine, and psychological influences. Despite the analysis of obesity in terms of these three

factors, the final common pathway to caloric balance lies in behavior mediated by the CNS. Recent attempts at pharmacotherapy of obesity has lead to widespread valvular heart disease in patients who received fenfluramine alone or in combination with phentermine (often referred to as fen-phen). Therefore, there is a need for a pharmaceutical agent to treat obesity.

General CNS diseases to be treated by the compounds of the present invention include cognitive disorders such as mild cognitive impairment, Alzheimer's disease, and attention deficit disorder with or without hyperactivity. Alzheimer's disease (AD) is a complex disease related with age that slowly progresses to loss of memory and language skills, with the related problems of having difficulties in learning and making decisions and judgments. Approximately 4 million Americans are reported to be suffering from AD. Currently available drugs, tacrine, donepezil and rivostigmine, are used to only retard the progression of the disease. The above-mentioned drugs are to enhance the cholinergic transmission. However, these drugs have serious side effects. There is a need for a drug to treat AD more effectively and have fewer side effects. Meneses, A., Drug News Perspect., 2001, 14, 396-400.

The compounds of the present invention are useful in the treatment of 5-HT<sub>6</sub> implicated diseases or conditions, such as anxiety, depression, schizophrenia, stress-related disorders such as irritable bowel syndrome, panic, a phobia, obsessive compulsive disorder, obesity, post-traumatic stress syndrome, epilepsy, and other central nervous system (CNS) disorders in humans and animals. Methods for treating a disease or condition in a mammal, in which 5-HT<sub>6</sub> receptor is implicated, includes administering to a mammal, rectally, topically, orally, sublingually, or parenterally, from about 0.001 to about 100 mg/kg, e.g., from about 0.1 to about 50 mg/kg, of body weight of said mammal per day of compound(s) of Formula I.

The 5-arylsulfonyl indoles (I) of the present invention interact with serotonin receptors, such as 5-HT<sub>6</sub> receptors, and are useful in the treatment of anxiety,

depression, schizophrenia, Alzheimer's disease, stress-related disorders such as irritable bowel syndrome, panic, a phobia, obsessive compulsive disorder, obesity, post-traumatic stress syndrome, epilepsy, and other CNS disorders. It is preferred that the 5-arylsulfonyl indole (I) be used to treat anxiety or depression.

To treat anxiety, depression, or other CNS diseases, the 5-arylsulfonyl indoles (I) are administered orally, sublingually, transdermally or parenterally to provide a dosage of about 0.1 to about 50 mg/kg/day. It is preferred that the dosage range be from about 0.1 to about 10 mg/kg/day. The 5-arylsulfonyl indoles (I) can be administered in divided doses either two, three or four times daily. For parenteral administration, a saline solution, dextrose solution, or water may be used as a suitable carrier. Formulations for parenteral administration may be in the form of aqueous or non-aqueous isotonic sterile injection solutions or suspensions. These solutions and suspensions may be prepared from sterile powders or granules having one or more of the carriers or diluents mentioned for use in the formulations for oral administration. The compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, peanut oil, sesame oil, benzyl alcohol, sodium chloride, and/or various buffers. Other adjuvants and modes of administration are well and widely known in the pharmaceutical art. It is preferred that the 5-arylsulfonyl indoles (I) be administered orally.

The exact dosage and frequency of administration depends on the particular 5-arylsulfonyl indole(s) used, the particular disease being treated, the severity of the disease being treated, the age, weight, general physical condition of the particular patient, other medication the individual may be taking as is well known to those skilled in the art and can be more accurately determined by measuring the blood level or concentration of the 5-

arylsulfonyl indole (I) in the patient's blood and/or the patient's response to the particular condition being treated.

The 5-arylsulfonyl indole (I) compounds of the present invention may be incorporated into pharmaceutical compositions for treating different CNS diseases, such as anxiety or depression. The pharmaceutical compositions may include one or more 5-arylsulfonyl indole (I) compounds. The compositions also may contain well known carriers and excipients in addition to a therapeutically effective amount of compounds of Formula I. The term "carrier" material or "excipient" herein means any substance, not itself a therapeutic agent, used as a carrier and/or diluent and/or adjuvant, or vehicle for delivery of a therapeutic agent to a subject or added to a pharmaceutical composition to improve its handling or storage properties or to permit or facilitate formation of a dose unit of the composition into a discrete article such as a capsule or tablet suitable for oral administration. Excipients can include, by way of illustration and not limitation, diluents, disintegrants, binding agents, adhesives, wetting agents, polymers, lubricants, glidants, substances added to mask or counteract a disagreeable taste or odor, flavors, dyes, fragrances, and substances added to improve appearance of the composition. Acceptable excipients include lactose, sucrose, starch powder, cellulose esters of alkanolic acids, cellulose alkyl esters, talc, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulfuric acids, gelatin, acacia gum, sodium alginate, polyvinyl-pyrrolidone, and/or polyvinyl alcohol, and then tableted or encapsulated for convenient administration. Such capsules or tablets may contain a controlled-release formulation as may be provided in a dispersion of active compound in hydroxypropyl-methyl cellulose, or other methods known to those skilled in the art. For oral administration, the

pharmaceutical composition may be in the form of, for example, a tablet, capsule, suspension or liquid. If desired, other active ingredients may be included in the composition.

In addition to the oral dosing, noted above, the compositions of the present invention may be administered by any suitable route, in the form of a pharmaceutical composition adapted to such a route, and in a dose effective for the treatment intended. The compositions may, for example, be administered parenterally, e.g., intravascularly, intraperitoneally, subcutaneously, or intramuscularly. For parenteral administration, saline solution, dextrose solution, or water may be used as a suitable carrier. Formulations for parenteral administration may be in the form of aqueous or non-aqueous isotonic sterile injection solutions or suspensions. These solutions and suspensions may be prepared from sterile powders or granules having one or more of the carriers or diluents mentioned for use in the formulations for oral administration. The compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, peanut oil, sesame oil, benzyl alcohol, sodium chloride, and/or various buffers. Other adjuvants and modes of administration are well and widely known in the pharmaceutical art.

The invention also includes isotopically-labeled compounds, which are identical to those recited in Formula 1, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, iodine, and chlorine, such as  $^3\text{H}$ ,  $^{11}\text{C}$ ,  $^{14}\text{C}$ ,  $^{13}\text{N}$ ,  $^{15}\text{O}$ ,  $^{18}\text{F}$ ,  $^{99\text{m}}\text{Tc}$ ,  $^{123}\text{I}$ , and  $^{125}\text{I}$ . Compounds of the present invention and pharmaceutically acceptable

salts and prodrugs of said compounds that contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of the invention.

Isotopically-labeled compounds of the present invention are useful in drug and/or substrate tissue distribution and target occupancy assays. For example, isotopically labeled compounds are particularly useful in SPECT (single photon emission computed tomography) and in PET (positron emission tomography).

Single-photon emission computed tomography (SPECT), acquires information on the concentration of isotopically labeled compounds introduced to a mammal's body. SPECT dates from the early 1960's, when the idea of emission traverse section tomography was introduced by D.E. Kuhl and R.Q. Edwards prior to either PET, x-ray CT, or MRI. In general, SPECT requires isotopes that decay by electron capture and/or gamma emission. Example of viable SPECT isotopes include, but are not limited to, 123-iodine ( $^{123}\text{I}$ ) and 99m-technetium ( $^{99\text{m}}\text{Tc}$ ). Subjects are injected with a radioactively labeled agent, typically at tracer doses. The nuclear decay resulting in the emission of a single gamma ray which passes through the tissue and is measured externally with a SPECT camera. The uptake of radioactivity reconstructed by computers as a tomogram shows tissue distribution in cross-sectional images.

Positron emission tomography (PET) is a technique for measuring the concentrations of positron-emitting isotopes within the tissues. Like SPECT, these measurements are, typically, made using PET cameras outside of the living subjects. PET can be broken down into several steps including, but not limited to, synthesizing a compound to include a positron-emitting isotope; administering the isotopically labeled compound to a mammal; and imaging the distribution of the positron activity as a function of time by emission tomography. PET is described, for example, by Alavi; et al. in

Positron Emission Tomography, published by Alan R. Liss, Inc. in 1985.

Positron-emitting isotopes used in PET include, but are not limited to, Carbon-11, Nitrogen-13, Oxygen-15, and Fluorine-18. In general, positron-emitting isotopes should have short half-lives to help minimize the long-term radiation exposure that a patient receives from high dosages required during PET imaging.

In certain instances, PET imaging can be used to measure the binding kinetics of compounds of this invention with 5-HT<sub>6</sub> serotonin receptors. For example, administering an isotopically labeled compound of the invention that penetrates into the body and binds to a 5-HT<sub>6</sub> serotonin receptor creates a baseline PET signal which can be monitored while administering a second, different, non-isotopically labeled compound. The baseline PET signal will decrease as the non-isotopically labeled compound competes for the binding to the 5-HT<sub>6</sub> serotonin receptor.

In general, compounds of formula I that are useful in performing PET or SPECT are those which penetrate the blood-brain barrier, exhibit high selectivity and modest affinity to 5-HT<sub>6</sub> serotonin receptors, and are eventually metabolized. Compounds that are non-selective or those that exhibit excessive or small affinity for 5-HT<sub>6</sub> serotonin receptors are, generally, not useful in studying brain receptor binding kinetics with respect to 5-HT<sub>6</sub> serotonin receptors. Compounds that are not metabolized may harm the patient. Preferred compounds for isotopic labeling and use in performing PET or SPECT include 2-[1-methyl-5-(phenylsulfonyl)-1H-indol-3-yl]ethanamine; 2-[1,2-dimethyl-5-(phenylsulfonyl)-1H-indol-3-yl]-N-methylethanamine; 2-[1,2-dimethyl-5-(phenylsulfonyl)-1H-indol-3-yl]ethanamine; 2-{5-[(3,5-difluorophenyl)sulfonyl]-1,2-dimethyl-1H-indol-3-yl}ethanamine; 2-{5-[(3,5-difluorophenyl)sulfonyl]-1,2-dimethyl-1H-indol-3-yl}-N-methylethanamine; 2-[2-methyl-

5-(1-naphthylsulfonyl)-1H-indol-3-yl]ethanamine; and pharmaceutically acceptable salts thereof.

In other embodiments, nuclear magnetic resonance spectroscopy (MRS) imaging can be used to detect the overall concentration of a compound or fragment thereof containing nuclei with a specific spin. In general, the isotopes useful in NMR imaging include, but are not limited to, hydrogen-1, carbon-13, phosphorus-31, and fluorine-19. For instance, compounds 2-{5-[(3,5-difluorophenyl)sulfonyl]-1,2-dimethyl-1H-indol-3-yl}ethanamine; 2-{5-[(3,5-difluorophenyl)sulfonyl]-1,2-dimethyl-1H-indol-3-yl}-N-methylethanamine; and pharmaceutically acceptable salts thereof, when containing  $^{19}\text{F}$  are useful in conducting NMR imaging.

Further, substitution with heavier isotopes such as deuterium, i.e.,  $^2\text{H}$ , can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements and, hence, maybe preferred in some circumstances. Isotopically labeled compounds of Formula I of this invention can generally be prepared by carrying out the synthetic procedures described above by substituting an isotopically labeled reagent for a non-isotopically labeled reagent.

#### DEFINITIONS AND CONVENTIONS

The definitions and explanations below are for the terms as used throughout this entire document including both the specification and the claims.

##### I. CONVENTIONS FOR FORMULAS AND DEFINITIONS OF VARIABLES

The chemical formulas representing various compounds or molecular fragments in the specification and claims may contain variable substituents in addition to expressly defined structural features. These variable substituents are identified by a letter or a letter followed by a numerical subscript, for example, "Z<sub>1</sub>" or

"R<sub>i</sub>" where "i" is an integer. These variable substituents are either monovalent or bivalent, that is, they represent a group attached to the formula by one or two chemical bonds. For example, a group Z<sub>1</sub> would represent a bivalent variable if attached to the formula CH<sub>3</sub>-C(=Z<sub>1</sub>)H. Groups R<sub>i</sub> and R<sub>j</sub> would represent monovalent variable substituents if attached to the formula CH<sub>3</sub>-CH<sub>2</sub>-C(R<sub>i</sub>)(R<sub>j</sub>)-H. When chemical formulas are drawn in a linear fashion, such as those above, variable substituents contained in parentheses are bonded to the atom immediately to the left of the variable substituent enclosed in parenthesis. When two or more consecutive variable substituents are enclosed in parentheses, each of the consecutive variable substituents is bonded to the immediately preceding atom to the left, which is not enclosed in parentheses. Thus, in the formula above, both R<sub>i</sub> and R<sub>j</sub> are bonded to the preceding carbon atom. Also, for any molecule with an established system of carbon atom numbering, such as steroids, these carbon atoms are designated as C<sub>i</sub>, where "i" is the integer corresponding to the carbon atom number. For example, C<sub>6</sub> represents the 6 position or carbon atom number in the steroid nucleus as traditionally designated by those skilled in the art of steroid chemistry. Likewise the term "R<sub>6</sub>" represents a variable substituent (either monovalent or bivalent) at the C<sub>6</sub> position.

Chemical formulas or portions thereof drawn in a linear fashion represent atoms in a linear chain. The symbol "-" in general represents a bond between two atoms in the chain. Thus CH<sub>3</sub>-O-CH<sub>2</sub>-CH(R<sub>i</sub>)-CH<sub>3</sub> represents a 2-substituted-1-methoxypropane compound. In a similar fashion, the symbol "=" represents a double bond, e.g., CH<sub>2</sub>=C(R<sub>i</sub>)-O-CH<sub>3</sub>.

The carbon atom content of variable substituents is indicated in one of two ways. The first method uses a prefix to the entire name of the variable such as

"C<sub>1</sub>-C<sub>4</sub>", where both "1" and "4" are integers representing the minimum and maximum number of carbon atoms in the variable. The prefix is separated from the variable by a space. For example, "C<sub>1</sub>-C<sub>4</sub> alkyl" represents alkyl of 1 through 4 carbon atoms, (including isomeric forms thereof unless an express indication to the contrary is given). Whenever this single prefix is given, the prefix indicates the entire carbon atom content of the variable being defined. Thus C<sub>2</sub>-C<sub>4</sub> alkoxy carbonyl describes a group CH<sub>3</sub>-(CH<sub>2</sub>)<sub>n</sub>-O-CO- where n is zero, one or two. By the second method the carbon atom content of only each portion of the definition is indicated separately by enclosing the "C<sub>1</sub>-C<sub>j</sub>" designation in parentheses and placing it immediately (no intervening space) before the portion of the definition being defined. By this optional convention (C<sub>1</sub>-C<sub>3</sub>) alkoxy carbonyl has the same meaning as C<sub>2</sub>-C<sub>4</sub> alkoxy carbonyl because the "C<sub>1</sub>-C<sub>3</sub>" refers only to the carbon atom content of the alkoxy group. Similarly while both C<sub>2</sub>-C<sub>6</sub> alkoxy alkyl and (C<sub>1</sub>-C<sub>3</sub>) alkoxy (C<sub>1</sub>-C<sub>3</sub>) alkyl define alkoxy alkyl groups containing from 2 to 6 carbon atoms, the two definitions differ since the former definition allows either the alkoxy or alkyl portion alone to contain 4 or 5 carbon atoms while the latter definition limits either of these groups to 3 carbon atoms.

By the term "effective amount" of a compound as provided herein is meant a nontoxic but sufficient amount of the compound(s) to provide the desired effect. As pointed out below, the exact amount required will vary from subject to subject, depending on the species, age, and general condition of the subject, the severity of the disease that is being treated, the particular compound(s) used, the mode of administration, and the like. Thus, it is not possible to specify an exact "effective amount." However, an appropriate effective amount may be determined by one of ordinary skill in the art using only routine experimentation.

## PREPARATION OF 5-ARYLSULFONYL INDOLES

The 5-arylsulfonyl indoles of the present invention may be prepared using the following reaction schemes:

Arylsulphonylphenylhydrazines can be prepared by the reactions outlined in Chart 1. The appropriately substituted thiols (1) are either known to those skilled in the art or can be readily prepared from known starting materials by means well known to those skilled in the art. Thiol (1) is coupled with the appropriately substituted 4-chloro-1-nitrobenzene (2) by known means to produce the thioether (3). There can be either one or two  $R^5$  groups. If  $R^5$  is other than -H, it should be part of the 4-chloro-1-nitrobenzene (2) so that it will become part of the unsubstituted arylsulfone (8) when it is formed. It is most difficult to add the  $R^5$  substituent (other than -H) to the unsubstituted arylsulfone (8) once it is formed. Therefore, the  $R^5$  group should be part of the appropriately substituted 4-chloro-1-nitrobenzene (2) when it is reacted with the thiol (1).  $R^5$  includes -H, -F and -Cl; it is preferred that  $R^5$  is -H. The thioether (3) is then oxidized with oxone followed by hydrogenation with rhodium on carbon (5%), all of which is known to those skilled in the art, to produce the amine (5). The amine (5) is then diazotized by (sodium) nitrite and (hydrochloric) acid followed by reduction with tin chloride to give the corresponding hydrazine (6).

Chart 1

Compounds of formula I can be prepared by the reactions outlined in Chart 2. Grandberg reaction using hydrazine (6) with  $\gamma$ -chloroketones (7) gives the formation of the indole (8). The amino group is protected with Boc to give compound (9), in which the indole nitrogen is alkylated with cesium carbonate in acetone and alkylating reagents (e.g.  $\text{Me}_2\text{SO}_4$ , alkyl halides). Compound (10) is further alkylated with sodium hydride and alkyl halides to generate compound (11). After deprotection, compound (12) is produced. Under reductive amination conditions with sodium cyanoborohydride in acetonitrile in the presence of aldehydes, compound (12) is converted to compound (13). The  $\gamma$ -chloroketones (7) are commercially available or can be made by procedures well known in the art. The procedures and conditions for the Grandberg, protection, deprotection, alkylation and reductive amination steps of Chart 2 are well known to those skilled in the art.

Chart 2

Compounds of formula I can also be prepared by the reactions outlined in Chart 3. The Boc protected compound (9) is reduced with  $\text{LiAlH}_4$  to lead to the formation of the corresponding methyl compound (14).

## Chart 3

Compounds of formula I can also be prepared by the reactions outlined in Chart 4. The Boc protected compound (10) is treated with acids (e.g. HCl) to lead to the formation of the amino compound (15).

## Chart 4

Compounds of formula I can also be prepared by the reactions outlined in Chart 5. The indole compound (13) is treated with a reducing reagent such as sodium cyanoborohydride in an acid media such as trifluoroacetic acid or acetic acid to lead to the formation of the indoline compound (16).

## EXAMPLES

Without further elaboration, it is believed that one skilled in the art can, using the preceding description, practice the present invention to its fullest extent. The following detailed examples describe how to prepare

the various compounds and/or perform the various processes of the invention and are to be construed as merely illustrative, and not limitations of the preceding disclosure in any way whatsoever. Those skilled in the art will promptly recognize appropriate variations from the procedures both as to reactants and as to reaction conditions and techniques.

PREPARATION 1: Preparation of 4-[(4'-methylphenyl)sulfonyl]-1-phenylhydrazine

Step 1: Preparation of 4-[(4'-methylphenyl)thio]-1-nitrobenzene. A mixture of 4-methylbenzenethiol (40.0 g, 0.322 mol), 1-chloro-4-nitrobenzene (55.5 g, 0.352 mol) and  $K_2CO_3$  (89.0 g, 0.644 mol) in acetonitrile (1.3 L) was stirred at room temperature under nitrogen for 20 h. The mixture was diluted with  $H_2O$  (2.0 L) and extracted with  $CH_2Cl_2$  (3 x 1.0 L). The combined extracts were dried over  $Na_2SO_4$ , concentrated *in vacuo*, and the crude product was recrystallized from (2.5:7) EtOAc/hexane (950 mL) to give 52.0 g (66%) of the title compound as a colorless solid.  $^1H$  NMR (300 MHz,  $CDCl_3$ )  $\delta$  2.41 (s, 3 H), 7.14 (d,  $J$  = 9.0 Hz, 2 H), 7.27 (d,  $J$  = 8.4 Hz, 2 H), 7.44 (d,  $J$  = 8.4 Hz, 2 H), 8.04 (d,  $J$  = 9.0 Hz, 2 H).

Step 2: Preparation 4-[(4'-methylphenyl)sulfonyl]-1-nitrobenzene. To a 0 °C solution of 4-[(4'-methylphenyl)thio]-1-nitrobenzene (50.0 g, 0.204 mol) in (1:1) THF/ $CH_3OH$  (3.0 L) was added a solution of oxone (280.0 g, 0.440 mol) in  $H_2O$  (1.5 L) over 30 min. The reaction was stirred for 16 h while allowing the cooling bath to expire. The solution was concentrated to ~ 1/3

the original volume and filtered. The solids were washed with H<sub>2</sub>O (300 mL) and Et<sub>2</sub>O (100 mL) then dried under vacuum to give the crude product, which was recrystallized from (1:4) EtOAc/hexane (1.0 L) to afford 43.0 g (77%) of the title compound as a colorless solid. <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>) δ 2.43 (s, 3 H), 7.37 (d, J = 8.1 Hz, 2 H), 7.87 (d, J = 8.1 Hz, 2 H), 8.13 (d, J = 9.0 Hz, 2 H), 8.35 (d, J = 9.0 Hz, 2 H).

Step 3: Preparation of 4-[(4'-methylphenyl)sulfonyl]-aniline. To a solution of 4-[(4'-methylphenyl)sulfonyl]-1-nitrobenzene, (30.0 g, 0.1 mol) in CH<sub>3</sub>OH (1.2 L) in a Paar bottle was added with 5%<sub>w</sub>t Rh on C (2.8 g) and the resulting mixture was alternatively evacuated and purged with H<sub>2</sub> (x5), then shaken under H<sub>2</sub> (55 psi) for 48 h. The reaction mixture was filtered through a bed of celite and the solids were rinsed with CH<sub>2</sub>Cl<sub>2</sub> (1.0 L) and CH<sub>3</sub>OH (1.0 L). The combined filtrates were concentrated in vacuo to afford 24.54 g (92%) of colorless solid, which was used without further purification. <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.37 (s, 3 H), 4.20 (br, 2 H), 6.65 (d, J = 9.0 Hz, 2 H), 7.26 (d, J = 7.2 Hz, 2 H), 7.69 (d, J = 8.7 Hz, 2 H), 7.78 (d, J = 8.4 Hz, 2 H).

Step 4: Preparation of 4-[(4'-methylphenyl)sulfonyl]-1-phenylhydrazine. To a 0 °C solution of 4-[(4'-methylphenyl)sulfonyl]aniline (23.0 g, 93.0 mmol) in concentrated HCl (250 mL) was added a solution of NaNO<sub>2</sub> (7.2 g, 0.104 mol) in H<sub>2</sub>O (113 mL) dropwise over 15 min. The resulting heterogeneous mixture was stirred for 30 min at 0 °C then a solution of SnCl<sub>2</sub> (42.9 g, 0.226 mol) in concentrated HCl (114 mL) was dropwise added over 10 min. The reaction mixture was stirred at 0 °C for 1 hr, then the cooling bath was removed and stirring was continued at room temperature for 1 h. The reaction mixture was filtered and the solids were suspended in H<sub>2</sub>O

(150 mL) and the suspension was made basic (pH>12) by addition of 50%<sub>wt</sub> NaOH. The mixture was filtered and the solid was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (600 mL) and washed with brine (200 mL). The organic layer was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated in vacuo to provide the crude product, which was purified by recrystallizing from (1:5) CH<sub>2</sub>Cl<sub>2</sub>/hexane (950 mL) to afford 19.2 g (79 %) of the title compound as a pale yellow solid: mp 158-160 °C, in ~95% purity by <sup>1</sup>H NMR. <sup>1</sup>H NMR (300 MHz, DMSO-d<sub>6</sub>) δ 2.33 (s, 3 H), 4.24 (s, 2 H), 6.83 (d, *J* = 8.7 Hz, 2 H), 7.36 (d, *J* = 8.1 Hz, 2 H), 7.60 (d, *J* = 8.7 Hz, 2 H), 7.73 (d, *J* = 8.1 Hz, 2 H), 7.76 (s, 1 H); <sup>13</sup>C (75 MHz, d<sub>6</sub>-DMSO) δ 20.89, 110.16, 125.93, 126.47, 128.92, 129.79, 140.52, 142.89, 159.82. IR (ATR) 3335, 3285, 3135, 3090, 3064, 3033, 2979, 1585, 1511, 1347, 1287, 1141, 1101, 1072, 996 cm<sup>-1</sup>; MS (ESI +); 263.0 [MH]<sup>+</sup>.

EXAMPLE 1: 2-[1-methyl-5-(phenylsulfonyl)-1H-indol-3-yl]ethanamine hydrochloride

Step 1: Preparation of 2-[5-(phenylsulfonyl)-1H-indol-3-yl]ethanamine

A solution of 1-[4-(phenylsulfonyl)phenyl]hydrazine (3.73 g, 15.0 mmol) and 4-chlorobutanal (1.76 g, 16.5 mmol) in 9:1 methanol/water (15.0 mL) was heated to reflux for 4 days. The reaction mixture was concentrated in vacuo and the residue dissolved in MeOH and treated with activated carbon and filtered. #### 5-HT<sub>6</sub> RECEPTOR BINDING ASSAY

##### Growth of Cells and Membrane Preparation:

Hela cells containing the cloned human 5-HT<sub>6</sub> receptor were acquired from Dr. David R. Sibley's laboratory in National Institute of Health (see Sibley, D.R., J. Neurochemistry, 66, 47-56, 1996). Cells were grown in high glucose Dulbecco's modified Eagle's medium, supplemented with L-glutamine, 0.5% sodium pyruvate, 0.3% penicillin-streptomycin, 0.025% G-418 and 5% Gibco fetal bovine serum and then were harvested, when confluent, in cold phosphate buffered saline.

Harvested intact cells were washed once in cold phosphate-buffered saline. The cells were pelleted and resuspended in 100 ml of cold 50 mM Tris, 5 mM EDTA and 5 mM EGTA, pH 7.4. Homogenization was with a Vir Tishear

generator, 4 cycles for 30 seconds each at setting 50. The homogenized cells were centrifuged at 700 RPM (1000 X g) for 10 minutes and the supernatant was removed. The pellet was resuspended in 100 ml of the above buffer and rehomogenized for 2 cycles. The rehomogenized cells were then centrifuged at 700 RPM (1000 X g) for 10 minutes and the supernatant was removed. The combined supernatant (200ml) was centrifuged at 23,000 RPM (80,000 X g) for 1 hour in a Beckman Rotor (42.1 Ti). The membrane pellet was resuspended in 50-8- ml of assay buffer containing HEPES 20 mM, MgCl<sub>2</sub> 10 mM, NaCl 150 mM, EDTA 1mM, pH 7.4 and stored frozen in aliquots at -70°C.

#### 5-HT<sub>6</sub> Receptor Binding Assay

The radioligand binding assay used [<sup>3</sup>H]-lysergic acid diethylamide (LSD). The assay was carried out in Wallac 96-well sample plates by the addition of 11 µl of the test sample at the appropriate dilution (the assay employed 11 serial concentrations of samples run in duplicate), 11 µl of radioligand, and 178 µl of a washed mixture of WGA-coated SPA beads and membranes in binding buffer. The plates were shaken for about 5 minutes and then incubated at room temperature for 1 hour. The plates were then loaded into counting cassettes and counted in a Wallac MicroBeta Trilux scintillation counter.

#### Binding Constant (K<sub>i</sub>) Determination

Eleven serial dilutions of test compounds were distributed to assay plates using the PE/Cetus Pro/Pette pipetter. These dilutions were, followed by radioligand and the bead-membrane mixture prepared as described above. The specifically bound cpm obtained were fit to a one-site binding model using GraphPad Prism ver. 3.0. Estimated IC<sub>50</sub> values were converted to K<sub>i</sub> values using the Cheng-Prusoff equation (Cheng, Y. C. et al., Biochem. Pharmacol., 22, 3099-108, 1973). The K<sub>i</sub> values obtained as an average from the assay are shown in Table 1.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 02/24759

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☒ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

In view of the wording of the claims presently on file wherein the meanings of Aryl, R2-R5 are (partly) missing, which render it difficult, if not impossible, to determine the matter for which protection is sought, the present application fails to comply with the clarity requirements of Article 6 PCT (see also Rule 6.1(a) PCT) to such an extent that a meaningful search is impossible. Consequently, the search has been carried out for those parts of the application which do appear to be clear, namely for the compounds of formula (I) as specified on page 8, line 10 to page 9, line 5 of the description.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
